**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/812,429

**Applicant(s)**

FAULKNER ET AL.

**Examiner**

SCOTT BAUER

**Art Unit**

2836

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 07 February 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-22 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-5, 7-10, 12-17 and 19-22 is/are rejected.
- 7) ☒ Claim(s) 6, 11 and 18 is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 30 March 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1. Claims 1-5, 7-10, 12-17 & 19-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Maxim (Maxim Data Sheet 19-2735; Rev 0; 1/03) in view of Suessmilch (US 3,886,932).

With regard to Claims 1 & 13 Maxim, in figure 3, discloses a power supply system comprising: a power supply (Silver Box or Rectifiers); a load (output bus) coupled to the power supply via a power supply line to receive a voltage therefrom; a circuit protection device comprising: at least one switch device (Q1 & Q2) coupled between the power supply and the load on the power supply line; a first controller (MAX8536) coupled to the at least one switch for: monitoring current flow through the at least one switch; maintaining the at least one switch in an ON state while current flows through the at least one switch in a first direction; and causing the at least one switch to toggle to an OFF state if current flowing through the at least one switch (Q1) flows in a second direction (page 1); and a second controller (the device to provide the ENABLE

signal of Fig. 3) coupled to the first controller and causing the first controller to toggle the at least one switch to the OFF state (page 11 paragraph 4).

Maxim teaches that a timer input can be used as a logic enable pin by driving the gate of a MOSFET with an ENABLE signal which causes the first controller to toggle the at least one switch to an Off state. The external ENABLE signal would necessarily come from a second controller.

Maxim does not teach the second controller is coupled to the power supply line between the power supply and the at least one switch for sensing an amount of current flowing between the power supply and the at least one switch and causing the at least one switch to toggle to the OFF state when the current sensed by the second controller exceeds a reference value.

Suessmilch, in Figure 1, teaches an over current protection circuit comprising a second controller (5 & 6) coupled to a power supply line between a power supply (1) and an at least one switch (3) and coupled to the first controller (7) for sensing an amount of current flowing between the power supply and the at least one switch and causing the first controller (7) to toggle off the at least one switch to toggle to the OFF state when the current sensed by the second controller exceeds a reference value (column 2 lines 1-18).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Maxim with Suessmilch, by incorporating the overcurrent protection device of Suessmilch into the circuit of Maxim

by driving the FET of Maxim with the output of the circuit of Suessmilch, for the purpose of using the device of Maxim to prevent a load from burning out due to a short circuit.

With regard to Claims 2 & 14, Maxim in view of Suessmilch discloses the power supply system of Claims 1 & 13. Maxim further discloses that the at least one switch comprises a pair of MOSFETs (Q1 & Q2).

With regard to Claims 3 & 15, Maxim in view of Suessmilch discloses the power supply system of Claims 2 & 14. Maxim further discloses that the first controller comprises a first input (UVP) coupled to the power supply line between the pair of MOSFETs and the power supply, a second input (OVP) coupled to the power supply line between the pair of MOSFETs and the load, and an output (GATE) coupled to gate terminals of the pair of MOSFETs, wherein, when the output is in a first state, the pair of MOSFETs is in the ON state and when the output is in a second state, the pair of MOSFETs is in the OFF state.

With regard to Claims 4 & 16, Maxim in view of Suessmilch discloses the power supply system of Claims 3 & 15. Suessmilch further discloses that the second controller comprises a current sensing device (5) coupled to the power supply line between the power supply (1) and a switch (3) for sensing the current in the power supply line and outputting a sensed voltage corresponding to the sensed current, a comparing device (6) for comparing the sensed voltage to a reference voltage and outputting a first output

when the sensed voltage exceeds the reference voltage. Maxim further teaches a switch (FET coupled to the timer) coupled between the comparing device and the gate terminals of the pair of MOSFETs. In the device of Maxim in view of Suessmilch, the switch, upon receiving the first output of the comparing device (as enable), operates to toggle the pair of MOSFETs to the OFF state.

With regard to Claims 5 & 17, Maxim in view of Suessmilch discloses the power supply system of Claims 4 & 16. Maxim further discloses that the first controller comprises a timer device and, upon receiving the first output from the comparing device of Suessmilch, the second controller switch (Timer FET) operates to disable the timer, thus driving the output of the first controller from the first state to the second state, causing the pair of MOSFETs to toggle to the OFF state.

With regard to Claims 7 & 19, Maxim in view of Suessmilch discloses the power supply system of Claims 4 & 16. Suessmilch further discloses that, upon receiving the first output from the comparing device, the second controller switch operates to pull the control terminals from the first state to the second state, causing the pair of MOSFETs to toggle to the OFF state (column4 lines 23-37).

With regard to Claims 8 & 20, Maxim in view of Suessmilch discloses the power supply system of Claims 1 & 13. Maxim further discloses that the first controller comprises a first input (UVP) coupled to the power supply line between the at least one

switch and the power supply, a second input (OVP) coupled to the power supply between the at least one switch and the load, and an output (GATE) coupled to a control terminal of the at least one switch, wherein, when the output is in a first state, the at least one switch is in the ON state and when the output is in a second state, the at least one switch is in the OFF state.

With regard to Claims 9 & 21, Maxim in view of Suessmilch discloses the power supply system of Claims 8 & 20. Suessmilch further discloses that the second controller comprises a current sensing device coupled to the power supply line between the power supply and the at least one switch for sensing the current in the power supply line and outputting a sensed voltage corresponding to the sensed current, a comparing device for comparing the sensed voltage to a reference voltage and outputting a first output when the sensed voltage exceeds the reference voltage. Maxim further teaches a switch (TIMER FET) coupled between the comparing device of Suessmilch and the gate terminals of the at least one switch, wherein the switch, upon receiving the first output of the comparing device, operates to toggle the at least one switch to the OFF state.

With regard to Claim 10, Maxim in view of Suessmilch discloses the power supply system of Claim 9. Maxim further discloses that the first controller comprises a timer device and, upon the first output from the comparing device of Suessmilch, the controller switch (Timer FET) operates to disable the timer device, thus driving the

output of the first controller from the first state to the second state, causing the at least one switch to toggle to the OFF state.

With regard to Claim 12, Maxim in view of Suessmilch discloses the power supply system of Claim 9. Suessmilch further discloses that upon receiving the first output from the comparing device, the second controller switch operates to pull the control terminals from the first state to the second state, causing the at least one switch to toggle to the OFF state (column4 lines 23-37).

With regard to Claim 22, Maxim teaches a fault protection system and method of providing fault protection in a power supply system, the system and method comprising: monitoring, with a first controller, a current flowing from a power supply to a load via a power supply line; toggling, with the first controller, a switch device coupled between the power supply and the load in the power supply line from an ON state to an OFF state when the current begins to flow from the load to the power supply, a second controller (the device to generate the ENABLE signal), the second controller causing the first controller to toggle the switch device from the ON state to the OFF state (page 11 paragraph 4).

Maxim does not teach using the second controller to monitor the amplitude of the current flowing in the power supply line; and when the amplitude of the current in the power supply line exceeds a reference value, using the second controller to toggle the switch device from the ON state to the OFF state.

Suessmilch, teaches monitoring, with a second controller (5 & 6) the amplitude of the current flowing in the power supply line; and when the amplitude of the current in the power supply line exceeds a reference value, the second controller (5 & 6) causing the first controller (7) to toggle the switch device (3) from the ON state to the OFF state.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Maxim with Suessmilch as described above.

***Allowable Subject Matter***

2. Claims 6, 11 & 18 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Claims 6, 11 & 18 would be allowable if rewritten in independent form including all of the limitations of the base claim because the prior art of record does not teach or fairly suggest a power supply system of Claim 4 comprising an under voltage protection device wherein a second controller switch operates to enable the under voltage protection device, thus driving the output of the first controller from the first state to the second state.

Maxim, in the Figure "UVP FAULT WAVEFORM", teaches that the gate output switches from a first state to a second state, when the under-voltage protection input drops below a certain voltage level. However, the prior art of record does not teach

that the pin can be driven low with a switch when the current sensed by the second controller exceeds a reference value.

### ***Response to Arguments***

Applicant argues the combinability of the Maxim Data Sheet with Suessmilch. Applicant states that there is no evidence in the prior art that suggests the desirability to Drive the FET of Maxim with the output circuit of Suessmilch and that the rejection was constructed with improper hindsight reasoning.

In response to applicant's argument that the examiner's conclusion of obviousness is based upon improper hindsight reasoning, it must be recognized that any judgment on obviousness is in a sense necessarily a reconstruction based upon hindsight reasoning. But so long as it takes into account only knowledge which was within the level of ordinary skill at the time the claimed invention was made, and does not include knowledge gleaned only from the applicant's disclosure, such a reconstruction is proper. See *In re McLaughlin*, 443 F.2d 1392, 170 USPQ 209 (CCPA 1971).

Maxim provides a mean for preventing a current reversal in redundant systems but does not provide adequate means of protecting the load from the very real problem of an over current condition. Maxim is aware of the existence of fault protection circuitry as the ORING MOSFETs themselves are to prevent damage caused by a fault in the system. There however exists many faults which Maxim does not provide protection for

including arc faults, ground faults, over and under voltage conditions as well and over current conditions. Maxim further provides an ENABLE signal which is used to turn the MOSFETs on and off for various reasons. Maxim does not teach every possible reason that the device could be turned on and off but teaches that the signal would be provided by an external device.

Suessmilch teaches a circuit which sends an enable and disable signal to a device which controls the opening and closing of a switch to provide or withhold power to a load. Suessmilch teaches that a circuit external to the device that energizes the switch provides an ENABLE signal to the energizing circuit when the power is in a normal operating range and disables the device thus de-energizing the switch when the power is in an over voltage range. As stated in the previous action if one were interested in protecting a circuit that is energized and de-energized by the circuit taught by Maxim, then one of ordinary skill in the art would recognize that driving the ENABLE signal of Maxim with the circuit output of the device of Suessmilch would be an easy way to provide this protection. The motivation is to prevent the ORING MOSFETs of Maxim and the load from burning out due to a short circuit in the system. Many systems are provided with over voltage protection and as such it is believed that one of ordinary skill in the art would recognize that the combination of Maxim with Suessmilch would provide such a function. As such, the prior rejection is maintained.

***Conclusion***

3. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SCOTT BAUER whose telephone number is (571)272-5986. The examiner can normally be reached on M-F 9am-6pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Sherry can be reached on 571-272-2084. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
